Trabajo Práctico 8 - Implementación de Contenedores en Azure y Automatización con Azure CLI

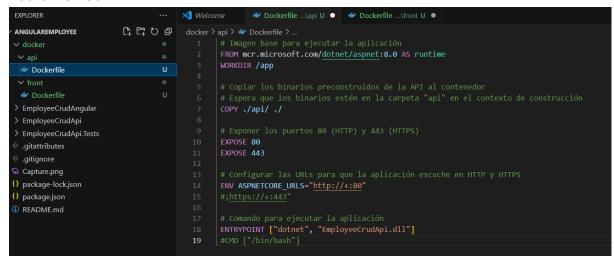

• Azure CLI instalado:

8.1 Se crea un directorio "docker" dentro del directorio raíz del proyecto que contiene 2 carpetas (api y front), y dentro de cada una de ellas se crean los correspondientes Dockerfile como se muestra a continuación.

Dockerfile Back:

Dockerfile Front:

Crear un recurso ACR en Azure Portal: (Siguiendo el instructivo)

Container Registry \Diamond Agregar a Favoritos

Crear

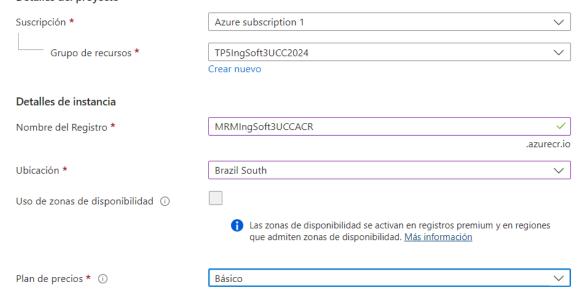

Microsoft | Azure Service

* 4.3 (370 clasificaciones)

Plan

Container Registry

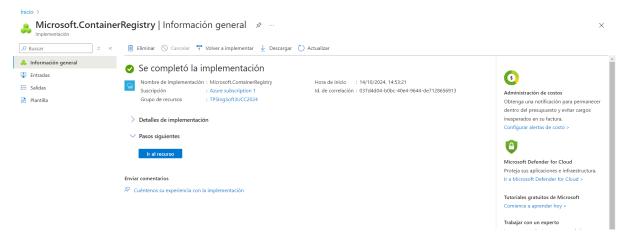

Detalles del proyecto

Crear Registro de contenedor

Copiar la url de nuestro recurso ACR: mrmingsoft3uccacr.azurecr.io

- Modificar nuestro pipeline en la etapa de Build y Test
 - Luego de la tarea de publicación de los artefactos de Back agregar la tarea de publicación de nuestro dockerfile de back para que esté disponible en etapas posteriores:

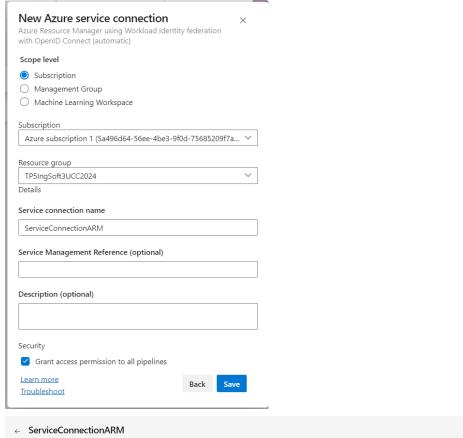

```
87
        - task: PublishBuildArtifacts@1
88
        displayName: 'Publicar artefactos de compilación'
 89
90
          inputs:
            PathtoPublish: '$(Build.ArtifactStagingDirectory)'
91
 92
            ArtifactName: 'api-drop'
 93
            publishLocation: 'Container'
94
95
        - task: PublishPipelineArtifact@1
 96
97
         displayName: 'Publicar Dockerfile de Back'
98
          inputs:
99
            targetPath: '$(Build.SourcesDirectory)/docker/api/dockerfile'
           artifact: 'dockerfile-back'
100
101
102
      - job: BuildAngular
        displayName: "Build and Test Angular"
103
104
        pool:
105
         vmImage: 'ubuntu-latest'
106
        steps:
107
        - task: NodeTool@0
         displayName: 'Instalar Node.js'
108
109
         inputs:
110
        versionSpec: '22.x'
```

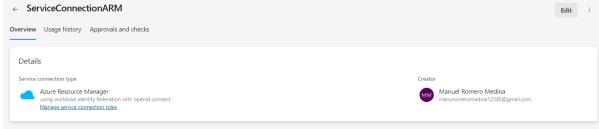

Luego de la tarea de publicación de los artefactos de **Front** agregar la tarea de publicación de nuestro dockerfile de front para que esté disponible en etapas posteriores:

```
- task: PublishBuildArtifacts@1
displayName: 'Publicar artefactos Angular'
inputs:
PathtoPublish: '$(frontPath)/dist'
ArtifactName: 'front-drop'

- task: PublishPipelineArtifact@1
displayName: 'Publicar Dockerfile de Back'
inputs:
| targetPath: '$(Build.SourcesDirectory)/docker/front/dockerfile'
artifact: 'dockerfile-front'
```

En caso de no contar en nuestro proyecto con una ServiceConnection a Azure Portal para el manejo de recursos, agregar una service connection a Azure Resource Manager como se indica en instructivo 5.2

Agregar a nuestro pipeline variables

```
trigger:
--main

pool:
|--vmImage:-'windows-latest'|

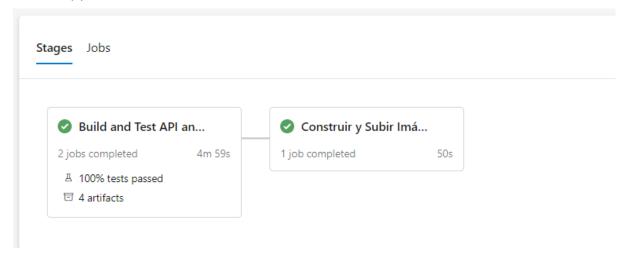

variables:
|--solution:-'**/*.sln'|
|--buildPlatform:-'Any-CPU'|
|--buildConfiguration:-'Release'|
|--frontPath:-'./EmployeeCrudAngular'|
|--backPath:-'./EmployeeCrudApi'|
|--ConnectedServiceName:-'ServiceConnectionARM'-#Por-ejemplo-'ServiceConnectionARM'|
|--acrLoginServer:-'mrmingsoft3uccacr.azurecr.io'-#Por-ejemplo-'ascontainerregistry.azurecr.io'|
|--backImageName:-'employee-crud-api'-#Por-ejemplo-'employee-crud-api'|
```

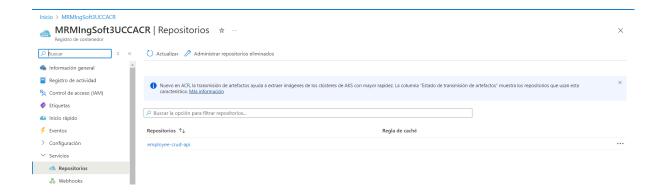

Agregar a nuestro pipeline una nueva etapa que dependa de nuestra etapa de Build y Test

- Agregar tareas para generar imagen Docker de Back:

```
° main ∨
                    ♦ TP07-Angular / azure-pipelines.yml *
       # · ### · STAGE · BUILD · DOCKER · IMAGES · Y · PUSH · A · AZURE · CONTAINER · REGISTRY
156
159
        - stage: DockerBuildAndPush
        displayName: 'Construir y Subir Imágenes Docker a ACR'
160
161
          dependsOn: BuildAndTest #NOMBRE DE NUESTRA ETAPA DE BUILD Y TEST
162
          jobs:
          --job: docker_build_and_push
164
             displayName: 'Construir y Subir Imágenes Docker a ACR'
165
             -pool:
              ·
·vmImage: ·'ubuntu-latest'
167
168
            -steps:
               ---checkout: self
170
171
172
               -#-BUILD-DOCKER-BACK-IMAGE-Y-PUSH-A-AZURE-CONTAINER-REGISTRY
173
174
               -- task: DownloadPipelineArtifact@2
175
                  displayName: 'Descargar Artefactos de Back'
176
                - unputs:
- buildType: 'current'
- artifactName: 'drop-back'
- targetPath: '$(Pipeline.Workspace)/drop-back'
177
178
180
181
                - ·task: DownloadPipelineArtifact@2
- ·displayName: 'Descargar Dockerfile de Back'
182
183
185
                   -buildType: 'current'
                    artifactName: 'dockerfile-back'
targetPath: '$(Pipeline.Workspace)/dockerfile-back'
186
```

Ejecutar el pipeline y en Azure Portal acceder a la opción Repositorios de nuestro recurso Azure Container Registry. Verificar que exista una imagen con el nombre especificado en la variable backImageName asignada en nuestro pipeline.

Agregar a nuestro pipeline una nueva etapa que dependa de nuestra etapa de Construcción de Imagenes Docker y subida a ACR

• Agregar variables a nuestro pipeline:

ResourceGroupName: 'NOMBRE_GRUPO_RECURSOS' #Por ejemplo 'TPS_INGSOFT3_UCC' backContainerInstanceNameQA: 'NOMBRE_CONTAINER_BACK_QA' #Por ejemplo 'as-crud-api-qa' backImageTag: 'latest'

container-cpu-api-qa: 1 #CPUS de nuestro container de QA container-memory-api-qa: 1.5 #RAM de nuestro container de QA

← New variable

Name
cnn_string_qa
Value
✓ Keep this value secret
Let users override this value when running this pipeline
To reference a variable in YAML, prefix it with a dollar sign and enclose it in parentheses. For example: \$(cnn_string_qa)
To use a variable in a script, use environment variable syntax. Replace . and space with, capitalize the letters, and then use your platform's syntax for referencing an environment variable. Examples:
Batch script: %CNN_STRING_QA%
PowerShell script: \${env:CNN_STRING_QA}
Bash script: \$(CNN_STRING_QA)
To use a secret variable in a script, you must explicitly map it as an environment variable.

Server=tcp:mrmsql.database.windows.net,1433;Initial Catalog=mrmsql;Persist Security Info=False;User

ID=sqladmin;Password=Manuromero1;MultipleActiveResultSets=False;Encrypt=Tru e;TrustServerCertificate=False;Connection Timeout=30;

Tenemos que modificar program.cs para que lea la variable de entorno y use esa cadena de conexión

 Agregar tareas para crear un recurso Azure Container Instances que levante un contenedor con nuestra imagen de back

```
### - STAGE - DEPLOY - TO - ACI - OA
--stage: DeployToACIQA
  displayName: 'Desplegar en Azure Container Instances (ACI) QA'
  dependsOn: DockerBuildAndPush
      - job: deploy_to_aci_qa
        ·displayName: ·'Desplegar · en · Azure · Container · Instances · (ACI) · QA'
        pool:
        · vmImage: 'ubuntu-latest'
          # · DEPLOY · DOCKER · BACK · IMAGE · A · AZURE · CONTAINER · INSTANCES · QA
            ·displayName: 'Desplegar Imagen Docker de Back en ACI QA'
              . azureSubscription: '$(ConnectedServiceName)'
               scriptType: bash
               scriptLocation: inlineScript
               inlineScript: |
                ·echo·"Resource·Group: ·$(ResourceGroupName)'
                echo "Container Instance Name: $(backContainerInstanceNameQA)"
                echo "ACR Login Server: $(acrLoginServer)"
                echo "Image Name: $(backImageName)"
                --echo-"Image-Tag: $(backImageTag)"
--echo-"Connection-String: $(cnn-string-qa)"
                ·az·container·delete·--resource-group·$(ResourceGroupName)·--name $(backContainerInstanceNameQA)·--yes
                 -az · container · create · -- resource-group · $(ResourceGroupName) · \
              · · · · -- name $(backContainerInstanceNameQA) · \
```

Para que funcione, hay que habilitar el acceso administrativo de ACR desde azure CLI

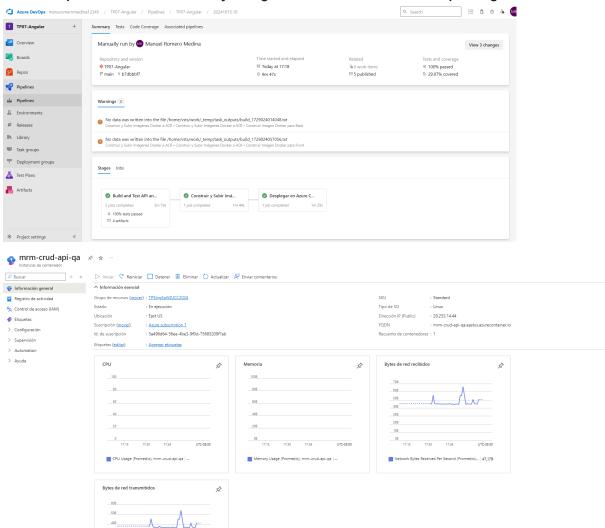

```
PS C:\Users\Manu> az acr update -n MRMIngSoft3UCCACR --admin-enabled true
>>
{
    "adminUserEnabled": true,
    "anonymousPullEnabled": false,
    "creationDate": "2024-10-14T17:53:22.687314+00:00",
    "dataEndpointEnabled": false,
    "dataEndpointEnabled": false,
    "dataEndpointEnabled": false,
    "dataEndpointHostNames": [],
    "encryption": {
        "keyVaultProperties": null,
        "status": "disabled"

    },
    "id": "/subscriptions/5a496d64-56ee-4be3-9f0d-75685209f7ab/resourceGroups/TP5IngSoft3UCC2024/providers/Microsoft.ContainerRegistry/registries/MRMIngSoft3UCCACR",
    "identity": null,
    "location": "brazilisouth",
    "loginServer": "memingsoft3uccacr.azurecr.io",
    "metadataSearch": "Disabled",
    "name": "MRMIngSoft3UCCACR",
    "networkRuleSpyasSoftJoccacr.",
    "networkRuleSpya
```

Además, debemos registrar el proveedor de recursos Microsoft.ContainerInstance, que es necesario para crear instancias de contenedores en Azure.

```
PS C:\Users\Manu> az provider register --namespace Microsoft.ContainerInstance
>>
Registering is still on-going. You can monitor using 'az provider show -n Microsoft.ContainerInstance'
```

8.10 - Ejecutar el pipeline y en Azure Portal acceder al recurso de Azure Container Instances creado. Copiar la url del contenedor y navegarlo desde browser. Verificar que traiga datos.

DESAFÍOS

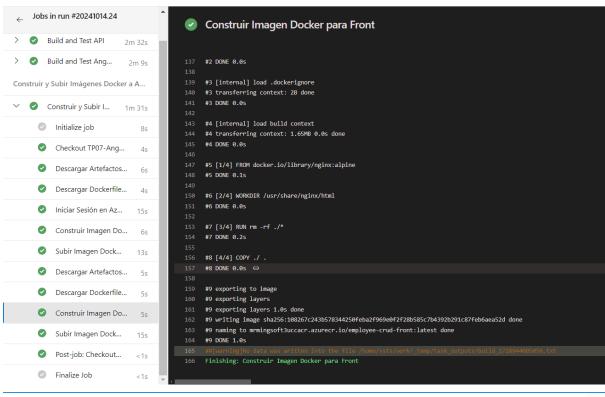

1. Agregar tareas para generar imagen Docker de Front

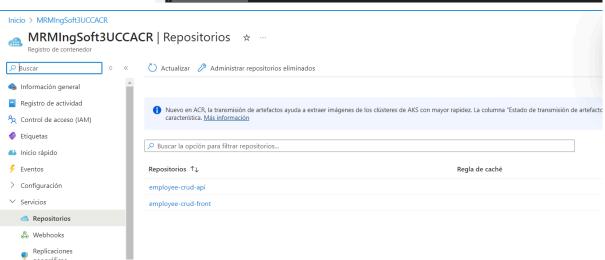

Agregar tareas para generar imagen Docker de Front (DESAFIO)

 A la etapa creada en 4.1.6 Agregar tareas para generar imagen Docker de Front

```
backImageName: 'employee-crud-api' #Por
frontImageName: 'employee-crud-front'
```

```
# BUILD DOCKER FRONT IMAGE Y PUSH A AZURE CONTAINER REGISTRY
- task: DownloadPipelineArtifact@2
   displayName: 'Descargar Artefactos de Front'
   ·inputs:
   buildType: 'current'
     artifactName: 'front-drop'
   targetPath: '$(Pipeline.Workspace)/drop-front'
   - task: DownloadPipelineArtifact@2
   displayName: 'Descargar Dockerfile de Front'
    inputs:
   buildType: 'current'
artifactName: 'dockerfile-front'
   targetPath: '$(Pipeline.Workspace)/dockerfile-front'
   - task: Docker@2
   displayName: 'Construir Imagen Docker para Front'
     command: build
      repository: $(acrLoginServer)/employee-crud-front # Cambia el nombre de la imagen según sea necesario
      -dockerfile: $(Pipeline.Workspace)/dockerfile-front/Dockerfile
-buildContext: $(Pipeline.Workspace)/drop-front
   · tags: 'latest'
   Settings
   - task: Docker@2
   displayName: 'Subir Imagen Docker de Front a ACR'
      command: push
       repository: $(acrLoginServer)/employee-crud-front # Cambia el nombre de la imagen según sea necesario
      tags: 'latest'
```

- 2. Agregar tareas para generar en Azure Container Instances un contenedor de imagen Docker de Front. (Complemento con 4.1.11)
 - Creamos la variable
 - ← Update variable

Name
API_URL
Value
mrm-crud-api-qa.eastus.azurecontainer.io/api/employee/getall
Keep this value secret
Let users override this value when running this pipeline
To reference a variable in YAML , prefix it with a dollar sign and enclose it in parentheses. For example: \$(API_URL)
To use a variable in a script , use environment variable syntax. Replace . and space with _ , capitalize the letters, and then use your platform's syntax for referencing an environment variable. Examples:
Batch script: %API_URL%
PowerShell script: \${env:API_URL}
Bash script: \$(API_URL)

mrm-crud-api-qa.eastus.azurecontainer.io/api/employee/getall

Instalamos lo necesario

}
```

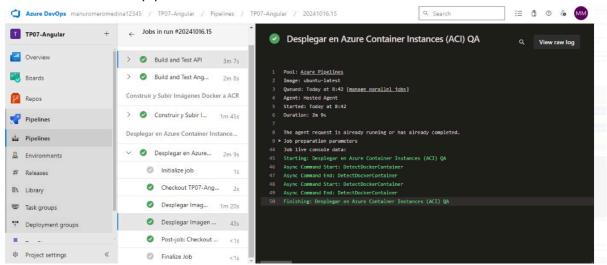

Agregamos las siguientes variables de entorno

```
- frontContainerInstanceNameQA: 'mrm-crud-front-qa' - # Por ejemplo, cambiar según tu entorno
- container-cpu-front-qa: 1
- container-memory-front-qa: 1.5
- frontImageTag: 'latest'
```

Agregamos las tareas para que levante el contenedor de front

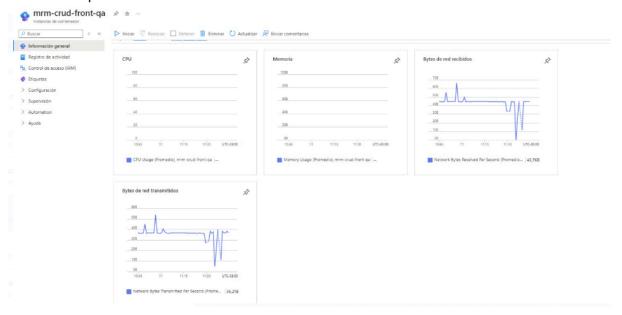

```
# - DEPLOY - DOCKER - FRONT - IMAGE - A - AZURE - CONTAINER - INSTANCES - QA
#----
  task: AzureCLI@2
  displayName: 'Desplegar Imagen Docker de Front en ACI QA'
  inputs:
   -azureSubscription:-'$(ConnectedServiceName)'
    scriptType: bash
    scriptLocation: inlineScript
    inlineScript:
     echo "Resource Group: $(ResourceGroupName)"
      echo · "Container · Instance · Name: $(frontContainerInstanceNameQA)" · · # · Debes · agregar · la · variable · para · el · front
      echo "ACR Login Server: $(acrLoginServer)"
      echo·"Image·Name: $(frontImageName)"
      echo "Image Tag: $(frontImageTag)"
      echo-"Api-Url: $(API URL)"
      az container delete -- resource-group $(ResourceGroupName) -- name - $(frontContainerInstanceNameQA) -- yes
      -az-container-create---resource-group-$(ResourceGroupName)-\
             ---name-$(frontContainerInstanceNameQA)-\
             --image $(acrLoginServer)/$(frontImageName):$(frontImageTag) \
             ---registry-login-server-$(acrLoginServer)-\
            ---registry-username $(acrName) \
---registry-password $(az acr-credential-show---name $(acrName) ---query "passwords[0].value" --o tsv) \
             ---dns-name-label-$(frontContainerInstanceNameQA)-\
             --ports-80-\
             --environment-variables-API_URL="$(API_URL)".\
            ---restart-policy-Always-\
---cpu-$(container-cpu-front-qa)-\
             --memory $(container-memory-front-qa)
```

Corremos el pipeline

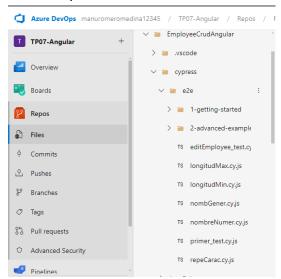

Comprobamos

- 3. Agregar tareas para correr pruebas de integración en el entorno de QA de Back y Front creado en ACI. (Complemento con 4.1.12)
 - Modificamos el pipeline con un "Stage Cypress" (VER PORQUE NO ME EJECUTAN LAS PRUEBAS)

```
# STAGE: CYPRESS TESTING
- stage: CypressTesting
  displayName: 'Pruebas E2E con Cypress'
    ---job: IntegrationTesting
      variables:
       baseUrl: '$(frontContainerInstanceNameQA).eastus.azurecontainer.io'
      steps:
         --script:
           · · · cd · $(Build.SourcesDirectory)/EmployeeCrudAngular
         onpm install typescript ts-node displayName: 'Instalar TypeScript'
        if-not-exist $(Build.SourcesDirectory)\EmployeeCrudAngular\cypress\results - mkdir "$(Build.SourcesDirectory)\EmployeeCrudAngular\cypress\results" - displayName: 'Crear el directorio de resultados'
        --script:-|
          ----npx-cypress-run---config-file-cypress.config.ts---env-baseUrl=$(baseUrl)
--displayName: 'Ejecutar-Pruebas-E2E-con-Cypress'
         - task: PublishTestResults@2
           inputs:
             testResultsFiles: '$(Build.SourcesDirectory)/EmployeeCrudAngular/cypress/results/*.xml'
           testRunTitle: 'Pruebas EZE con Cypress (QA)'
displayName: 'Publicar Resultados de las Pruebas de Cypress'
```
